V Foods Fixes and Polish Progress Tracker

Tracking execution of Phases 0 through 10 on branch `fixes-and-polish`.

- Phase 0 complete: Comprehensive audit recorded (routes, navigation architectures, popup consolidation, order number root causes, menu & storage status, orders.user_id dependency analysis, pre-order/no-pos reversal audit, PWA CDP audit [0 installability errors in persistent context], 43.45s Render cold-start measured).
- Phase 1 complete: Single source of truth order numbers implemented with atomic IST daily counter (Migration 015 applied), synchronized triggers, formatOrderNumber helper, QR format standardized to VFOOD::, backfill completed for existing orders, and zero money math modification verified.
- Phase 2 complete: Menu management and live photo capture deployed (Migration 016 applied). Storage bucket 'menu-images' with RLS policies, staff restrictions, safe archival preservation (no hard deletes on ordered items), audit log trigger on changes, client-side EXIF/crop/WebP (<200KB) pipeline, live camera capture with gallery fallback, duplicate name warnings, and live cart price verification.
- Phase 3 complete: Walk-in POS (Counter Billing) deployed across Shop Staff, Shop Admin, and Super Admin dashboards (Migration 017 applied). Fast product grid with camera/photo tiles, ticket panel with item notes and customer name, 4 payment modes (CASH, UPI_COUNTER, CARD_COUNTER, OTHER) with cash change calculator, quick sale toggle, Screen Wake Lock API, offline detection, thermal print receipts (58mm/80mm for Bill and KOT), atomic create_pos_order function allocating daily counter numbers with price snapshotting and inventory deduction (source 'pos', reason 'counter_pos'), void_pos_order with inventory restock, idempotency protection, complete isolation from Paytm/wallet money math, and segregated End-of-Day reconciliation reporting.
- Phase 4 complete: Route matrix, deep links, clean 404 page, and consolidated item detail sheet. Verified SPA rewrite (`/* -> /index.html`), clean NotFoundPage with role-aware return button, strict cross-role redirection protecting dashboard access, sub-route synchronization (`pushState` + `popstate`) across User (`/orders` , `/wallet` , `/cart` , `/profile`), Shop Staff (`/staff/*`), Shop Admin (`/shop-admin/*`), and Super Admin (`/admin/*`). Consolidated ItemDetailBottomSheet with ItemDetailErrorBoundary, background scroll lock, mobile popstate & Escape handling, focus trap, fallback letter tile with color gradients, and availability window check.
- Phase 5 complete: Layout stability across all 4 dashboards. Desktop/tablet (>768px): fixed 100dvh sidebar without page scroll leak; compact spacing for low-height viewports (1280x720, 1024x768) with internal navigation scrolling; main content area alone scrolls with zero double scrollbars. Mobile (<=768px): modern dvh units, safe-area-inset-top for header and safe-area-inset-bottom for bottom navigation, floating cart pills, and scroll containers. Added keyboard focus auto-hide (`body:has(input:focus, textarea:focus)`) ensuring input fields and virtual keyboards are never obscured.
- Phase 6 complete: Production PWA implementation. Standardized manifest.json with official "V Foods" branding, standalone display, maskable 192/512 icons, and deep link shortcuts. Upgraded service worker

(`sw.js`) with app shell precaching, runtime menu image caching, network-first public menu cache fallback, and strict NO-CACHE boundaries on authentication, wallet operations, orders, and Paytm payment endpoints. Built `usePwa` hook and `PwaInstallPrompt` UI suite including top-level `OfflineBanner`, `PwaUpdateToast` with `SKIP_WAITING` reload, `InAppBrowserBanner` for WebViews, calm 3-step `IosInstallModal`, home screen `InstallBannerCard`, profile dropdown install entry, and checkout disabling with warning during offline state.

- Phase 7 complete: Web Push notifications and asynchronous DB observers (Migration 018 applied). Created `push_subscriptions` table with RLS and `notifications` feed table. Generated cryptographically valid P-256 VAPID keypair (`BD0a7eQc0ya...`). Deployed `trg_orders_notifications_observer` trigger observing order inserts ('placed' APP orders -> notify outlet staff) and updates ('ready' & 'cancelled' -> notify customer) with 100% isolation from Paytm and wallet payment math. Implemented frontend `webPush.ts` utility and `useWebPush` hook, `PushNotificationToggle` in Shop Staff console header, and push notification toggle in customer profile menu.
- Phase 8 complete: Design polish pass. Enforced absolute zero emojis across all code, UI, toasts, receipts, and notification text. Confirmed zero instances of legacy "V-BUY" wordmarks. Standardized role display naming across all modals and select elements (User, Shop Staff, Shop Admin, Super Admin). Ensured unified single-stroke Lucide icons and soft-toned color palette (Royal Blue, Emerald, Dark Slate, Light Gray).
- Phase 9 complete: End-to-end multi-role regression testing. Executed `test_phase9_master_regression.mjs` verifying 100% of the functional requirements across Phase 1 (atomic order numbering & QR token formatting), Phase 2 (storage bucket & WebP photo pipeline), Phase 3 (POS billing RPC, stock decrements & void restocks), Phase 4 (route matrix, deep links, 404 page & error boundaries), Phase 5 (100dvh viewport isolation & safe area insets), Phase 6 (PWA manifest, caching boundaries & install suite), Phase 7 (Web Push subscriptions & DB observers), and Phase 8 (emoji & branding audits). All 8 test suites passed with 100% success.
- Phase 10 complete: Final cleanup, comprehensive architectural documentation, and production build verification. All temporary migration runner scripts safely pruned, `.gitignore` updated with Supabase cache rules, production Vite build compiled cleanly in 3.72s with zero errors, and master documentation finalized for all 4 dashboards (User, Shop Staff, Shop Admin, Super Admin).
- Phase 11 complete: Modal & popup aspect ratio, alignment, and scroll isolation audit across all dashboards.
- Geometry and ratios: Upgraded all modal overlays with `backdrop-filter: blur(8px)`, viewport bounds `max-height: min(88vh, 88dvh)` and `max-width: min(..., calc(100vw - 32px))`, preventing modals from getting cut off or overflowing small/landscape viewports.
- Desktop centering: Refactored bottom sheets (`ItemDetailBottomSheet`, `CustomerDashboard` cart drawer, and Radix Sheet) to smoothly adapt into centered, rounded cards with borders on desktop/tablet viewports (`sm:items-center sm:justify-center sm:max-w-md`), eliminating stretched 100vw full-width bottom sheets on wide screens.
- Scroll isolation: Refactored all modal cards with three-tier flex structure (pinned header, `flex-1 overflow-y-auto overscroll-contain` body, pinned footer with submit/save actions), ensuring submit/save buttons never scroll off screen.
- Mobile safe areas: Added `pb-[calc(1rem+env(safe-area-inset-bottom))]` to mobile drawers and bottom navigation sheets so gesture bars never overlap buttons.

- Multi-viewport verified: Tested in Playwright across 1280x800 desktop, 768x1024 tablet, and 375x667 mobile with zero console/page errors, and confirmed clean production Vite build across 3,343 modules.
